**LARSON—MATH 556—HOMEWORK WORKSHEET 08**  
**Spanning Trees**

A **spanning tree**  $T$  of a connected graph  $G$  is a subgraph that is a tree and contains all the points of  $G$  (so  $V(T) = V(G)$  and  $E(T) \subseteq E(G)$ ).

For instance, let  $C_n$  be a cycle on  $n$  points and  $T$  be the graph formed by removing any single edge of  $C_n$ ; then  $T$  is a spanning tree of  $C_n$ .

We **proved**: Every connected graph has a spanning tree. That is, prove if  $G$  is a connected graph then there is a subgraph  $T$  of  $G$  which is a tree and includes all of the points of  $T$ .

1. Find a spanning tree for each of the following graphs:
  - (a)  $K_5$ .
  - (b)  $K_{3,4}$ .
  - (c) The house graph.
  - (d) The bow-tie graph.
  - (e) The Petersen graph
2. Let  $G$  be the Petersen graph. Find a spanning tree  $T$  with  $\nu(G) = \nu(T)$ .
3. Let  $G$  be a connected graph. Let  $M$  be a maximum matching of  $G$ . So  $M$  is a forest. Let  $F$  be a maximum forest containing all the lines of  $M$  (that is, there is no forest  $F'$  with all the lines of  $M$  and more lines than  $F$ ). Prove that  $F$  is connected.
4. Prove: every connected graph  $G$  has a spanning tree  $T$  with  $\nu(G) = \nu(T)$ .

**König & Dilworth**

5. Prove: Dilworth's Theorem implies König's Minimax Theorem.
